

Tectonics

INTRODUCTION TO A SPECIAL SECTION

10.1029/2021TC006939

Key Points:

- New data and recent analysis of structural geology of the Mediterranean regions
- Introduction to “Geodynamics, Crustal and Lithospheric Tectonics, and active deformation in the Mediterranean Regions”
- A tribute to Prof. Renato Funiciello

Introduction to the Special Section in “Geodynamics, Crustal and Lithospheric Tectonics, and Active Deformation in the Mediterranean Regions” (A Tribute to Prof. Renato Funiciello)

Mustapha Meghraoui¹ , Laurent Jolivet² , Rinus Wortel³, and Sandro Conticelli⁴ 

¹Institut Terre et Environnement de Strasbourg (ITES - UMR 7063), Strasbourg, France, ²UPMC, France, Paris, France,

³Utrecht University, Utrecht, The Netherlands, ⁴Università degli Studi di Firenze, Firenze, Italy

The geology, the geophysics, and other components of the solid earth system have much to contribute to our understanding of the Mediterranean region, from the Tethys paleo-environment to the present-day plate tectonic boundary. Launching a special collection with new and revised research contributions on the Tethyan belt (Mediterranean to Middle East), addressing subduction and mantle convection, volcanism, and fluid circulation, structural geology and active tectonics, dynamic topography, and geomorphology is a challenge. Attempting to embrace all these topics may seem ambitious, but this effort embodies the spirit of Renato Funiciello, the Mediterranean and Italian geologist who crossed the sea beforehand and spread the seeds of modern tectonics and geodynamics. This special section is dedicated to him.

This collection encompasses a broad spectrum of topics including regional and structural geology, deep-seated metamorphism and core complexes, active deformation, and tectonics, using diverse approaches, such as high-resolution topographic and GPS data, paleomagnetic and magnetic measurements, seismic tomography, isotopic dating, and analog/numerical modeling in either strike-slip extensional and contractional tectonic systems.

The contributions in this collection come from all over the Mediterranean region: from northern Africa to southern Europe, and from the regions of Anatolia in the east to the Atlas of Morocco in the west. The section includes the segmentation of the Aegean geodynamics and core complexes and proceeds with magmatic models (Brun & Sokoutis, 2018; Rabillard et al., 2018). The geodynamics of the eastern Tethyan belt is investigated through the Arabia-Eurasia collision from the Persian Mountains to the Central Taurides in Turkey (Darin et al., 2018; McPhee et al., 2018; Sadeghi-Bagherabadi et al., 2018). Modeling opposite subduction polarity follows the paleotracers of plate tectonics with the Adria microplate and the origin of the Apenninic arc (Király et al., 2018; Peral et al., 2018), along with the early Triassic volcanism in the Southern Alps (Bianchini et al., 2018), and continental mantle obduction (Gueydan et al., 2019) as a framework of the western Tethyan belt.

In the western Mediterranean, present-day geodynamics are addressed through GPS surveying and results from the western Alps (Rabin et al., 2018; Walpersdorf et al., 2018). The aeromagnetic investigation of the central Apennines shows the characteristics of the seismogenic zones (Minelli et al., 2018), followed by the contribution of Cucci et al. (2018) on the destructive M7.1 1915 Marsica earthquake near Rome.

The neotectonic structures and evolution of the central Mediterranean are addressed through studies of the burial-exhumation cycles by $^{40}\text{Ar}/^{39}\text{Ar}$ dating (Porkoláb et al., 2019), Plio-Pleistocene contraction versus extension (Storti et al., 2018), the three-dimensional structural architecture of Neogene low-angle normal faults (Molli et al., 2018), and the late Miocene-early Pliocene evolution from K-Ar dating and transpressive-collision in the Apennines and Calabrian Arc (Filice & Seeber, 2019; Viola et al., 2018). Late Miocene extension (Booth-Rea et al., 2018) and active faulting with related stress distribution (Soumaya et al., 2018) document the oblique convergence along the North African Atlas system.

The issue of volcanism and tectonics is addressed by contributions dealing with fluids and volcanic gases from active volcanoes of Central Italy (i.e., Alban Hills, Carapezza et al., 2019) and the Aegean Volcanic Arc (i.e., at Santorini, Tarchini et al., 2019). The relationships between genesis of magmas and tectonic setting of the Anatolia block are the topic of original papers dealing with crustal extension and the chemistry of

melt inclusions in alkaline rocks from Turkey (Asti et al., 2019; Nikogosian et al., 2018). Bianchini and co-authors discuss the tectonic setting and the genesis of some Triassic dyke swarm cropping out on the Alpine chain. A model that links the eruption rate at Etna volcano with the geodynamics is presented by Barreca et al. (2018).

As an addition and important input, the analysis of paleomagnetic data documents faulting processes and block rotations from the Moroccan and Algerian Atlas (Derder et al., 2019; Torres-López et al., 2018), through Sicily (Speranza et al., 2018), to the central Taurides (Koç et al., 2018).

Acknowledgments

The authors are indebted to Claudio Faccenna, John Geissman, and Taylor Schildgen for their support of the publication of the special collection. The authors are also thankful to Francesca Funiciello for her assistance in improving a previous version of the introduction to the special collection.
