Index

Note: Page numbers followed by "*f*" and "*t*" refer to figures and tables, respectively.

A

Agent-based models, 36, 284
Air source HPs (ASHPs), 191–192, 195–196, 213–214
A-line lamps, 234–236, 235*f*, 242*t*, 243, 248–249, 249*f*, 252
Alkaline electrolysis, 165, 269–270
  current and future markets, 179–182
  data availability and methodological issues, 170–174
  drivers, 178–179
  experience curve, 175–178
  future CAPEX, 182–183
  future drivers in CAPEX reduction, 182
  global hydrogen capacity, 168–170
Alkaline electrolyzer, 166, 169–171, 180–181
ASsessment of TRAnsport Strategies (ASTRA), 283, 285–288, 286*f*
  modular structure of, 285–286
  vehicle fleet and technology diffusion in, 286–288
A-type lamps, 240–243, 250

B

Balance of plant (BOP) costs, 177
Balance of system (BOS), 67
  BOS components, 27–28, 311
  BOS costs, 67
Battery electric vehicles (BEVs), 55–56, 58*f*, 59*f*, 147–148, 284
Battery storage technologies, 124, 127, 139
Bipolar designs, commercialization of, 167–168, 178–179
Bottom-up energy models, 35

C

Cadmium telluride (CdTe), 53, 65–66
Capacity factors, 91–92, 95–97, 106, 112, 112*f*
CAPEX, 170–171, 172*f*, 173, 173*f*, 174*f*, 178
  future CAPEX of alkaline electrolysis systems, 182–183
  future drivers in CAPEX reduction, 182
Capital expenditures (Capex), 90–93, 106, 310
Carbon capture and storage (CCS), 19, 41, 265, 273
  -related technologies, 268–269
  sensitivity of no technological learning for, 275
Carnot cycle, inverse, 191
Cell efficiency, 80, 179, 183–184
China, offshore wind capacity in, 104–105
Coal-fired power plants, 4
Coefficient of performance (COP), 201–202
Color-rendering index (CRI), 243
Combi gas boilers, 193
Combined-cycle gas turbines (CCGTs), 271–272
Component-based assessments, 311
Component-based manufacturing cost projections, 250
Compressed-air-energy storage, 123
Concentrating solar power (CSP), 221
  future outlook, 228–229
  learning curve analyses, 226–227
  methodological issues and data availability, 224–225
  price decline, main drivers of, 227–228
  technology options, 223*f*
  time trend analyses, 225–226
Condensing boilers, technology description of, 192–193
Consumer price index (CPI), 18, 203
Cost and price changes, main drivers behind, 110–113
Cost versus price data, 15–16
Crystalline silicon, 77–80, 79*f*
Cumulative energy demand (CED), 53
Current density, 179, 182

D

Data gathering issues, 19*t*
Data harmonization, 17–18
Decarbonization transportation, 160–161
Diffusion, defined, 54
Direct normal irradiance (DNI), 221

E

Early adopters (EAs), 54
Early majority (EM), 55
Electric car market deployment considering endogenous battery price development, 281
  assessment of transport strategies, 285–288
    modular structure of, 285–286
    vehicle fleet and technology diffusion in, 286–288
  comparison of the two models, 292
  comparison with other studies and limitations, 301–302
  effects of global learning via model coupling, 300
  electric vehicle market diffusion studies, status quo of, 283–284
  experience curves, implementation of, 293–294
  interface and feedback loops between models, 294
  motivation, 282–283
  results of reference scenario, 296–297
  scenario and sensitivity analyses, 295
  sensitivity analyses, 297–299
  system dynamics (SD) transport modeling, 284
  Transport, Energy, Economics, and Environment (TE3) model, 288–292
    modular structure of, 289
    vehicle fleet and technology diffusion in, 289–292
Electricity generation technologies, 66–67, 265
Electricity storage technologies, 126–127, 129*t*, 130, 132, 265–266
  data collection issues for, 126*t*
  experience curves for, 129*t*
  future cost of, 135*f*, 137*t*
  technology scope for, 130
ELectricity TRAnsshipment MODel (ELTRAMOD), 261–263, 274–275
  uncertainty of experience curve parameters in, 272–274
Electric vehicles (EVs), 120, 282
  battery electric vehicles (BEVs), 55–56, 58*f*, 59*f*, 147–148, 284
  deployment projection, 158*f*
  fuel cell electric vehicles (FCEVs), 148, 151
  hybrid electric vehicles (HEVs), 148
  plug-in hybrid electric vehicles (PHEVs), 56–57, 148, 284
  status quo of EV market diffusion studies, 283–284
Electric vehicles (EVs), 145, 154–156
  description of technology, 147–149
  future outlook, 156–160
  market development, 149–152
  methodological issues and data availability, 152–154
    data collection and methodological issues, 153–154
Electrolysis, defined, 166
Electrolysis–fuel cell combination, 136–137
Emerging technologies, 250–251
Endogenous technological learning, 39–41
Energy and climate models, application in, 313–314
Energy demand technologies, 266
  experience curves for energy efficiency in, 51–52
Energy efficiency, 212, 248, 249*f*, 253–254
Energy experience curves, 50–52
  for energy efficiency in energy demand technologies, 51–52
  for energy efficiency in industrial processes, 50–51
Energy modeling approaches, 34–36
  agent-based models, 36
  bottom-up models, 35
  integrated assessment models (IAMs), 36
  optimization models, 35
  simulation models, 35
  technological learning in, 43
  top-down models, 34
Energy models, experience curves in, 36–39, 257
  energy markets involved, overview of, 266–267
  exogenous technological learning, model results with, 267–275
    developments of novel technologies and concurrent price reductions, 267–270
    ELectricity TRAnsshipment MODel, uncertainty of experience curve parameters in, 272–274
    FORECAST, uncertainty of experience curve parameters in, 270
    PowerACE, uncertainty of experience curve parameters in, 270–272
    sensitivity of −50% of specific investment costs for batteries, 274–275
    sensitivity of no technological learning for carbon capture and storage technologies, 275
  key new and incumbent technologies, 264–266
    electricity generation technologies, 265
    electricity storages, 265–266
    energy demand technologies, 266
  modeling characteristics, 268*t*
  technical discussion on model implementation of experience curves, 37–39
    endogenous implementation, 38–39
    exogenous implementation, 38–39

technological progress and experience curves, 260
Energy system models, 260, 262*f*, 277
Environmental experience curves and social learning, 312–313
Environmental impacts, experience curves for, 52–54
Europe, offshore wind farms in, 104–105, 104*f*
European Heat Pump Association, 196
Exogenous learning, 270
Exogenous technological learning, 41–42, 267–275
developments of novel technologies and concurrent price reductions, 267–270
sensitivity of −50% of specific investment costs for batteries, 274–275
sensitivity of no technological learning for carbon capture and storage technologies, 275
uncertainty of experience curve parameters
in ELectricity TRAnsshipment MODel, 272–274
in FORECAST, 270
in PowerACE, 270–272
Experience curve, 5, 9, 13*f*, 33
analyses, 107–110
applications of, for policy makers, 21–27
direct applications, 23–26
indirect application, 26–27
empirical data collection for, 15–19
common issues with data collection, 18–19
cost versus price data, 15–16
data harmonization, 17–18
functional unit, 17
energy modeling approaches, 34–36
agent-based models, 36
bottom-up models, 35
integrated assessment models (IAMs), 36
optimization models, 35
simulation models, 35
top-down models, 34
estimation of parameters of, 20–21
determining fit accuracy and experience curve parameter errors, 20–21
regression method, 20
implementation of, 293–294
in energy models, 36–39
issues, caveats, and drawbacks of experience-curve implementation in energy models, 42–45
geographical scope of model, 42–43
technical issues, 43–44
technological learning in energy modeling system, 43
technology deployment constrained by modeling scenario and policy targets, 44
issues and drawbacks of, 27–29
cost reductions and causality, 28
nonconstant learning rates and learning rate uncertainty, 27
radical innovations, 28–29
technology quality, 29
technology systems and components, 27–28
learning curve and, 10–15
single factor experience curve, 11–12
two and multifactor experience curves, 12–15
multifactor experience curves (MFECs), 68
practical implications in different types of models, 39–42
endogenous technological learning, 39–41
exogenous technological learning, 41–42
state-of-the-art experience curves, 71–76
two-factor experience curve (TFEC), 76–77
Experience curves, application of, 49
for energy efficiency in energy demand technologies, 51–52
for energy efficiency in industrial processes, 50–51
for environmental impacts and life cycle assessment, 52–54
social learning (SL), 54–60
modeling risk premiums and social and technological learning, 55–56
technological learning scenarios, 57–60
in transport sector, 55
Experience rates (ERs), 125–126, 128–132

F

Flow batteries, 122
Fluorescent lamps, 234–235
Flywheels, 120, 123
FORECAST model, 262–263
uncertainty of experience curve parameters in, 270
F-test, 21
Fuel cell electric vehicles (FCEVs), 148, 151
Fuel cell vehicles (FCVs), 56
Fuel cells, 122–123
Functional unit, 17

G

Gas boilers
current market developments of, 193–196
methodological issues and data collection for, 206–207
General service lamps (GSLs), 248
Government-funded research, development, and demonstration (RD&D), 25

Greenhouse gases (GHGs), emission of, 3–4, 22–23, 53, 283
Grid-scale energy storage, 119
  future outlook, 134–138
  methodological issues and data availability, 124–129
  multifactor learning curves, 133–134
  one-factor learning curves, 130–133
Ground source HPs (GSHPs), 191–192, 213–214

H
Habit-oriented consumers, 291–292
Heating and cooling in the built environment, 189
  condensing boilers, technology description of, 192–193
  decreasing costs (prices) per unit
    in the case of gas boilers, 212–213
    for the case of heat pump borehole heat exchangers and heat pump modules, 210–212
    for the case of heat pumps, 207–210
  fossil heating systems and heat pumps, current market developments of
    case study for Switzerland, 200–202
  future market trends of heat pumps in The Netherlands and Switzerland, 213–215
  gas boilers and heat pumps, current market developments of
    case study for The Netherlands, 197–200
  heat pumps, technology description of, 191–192
  market development, in the EU, 193–197
    of gas boilers, 193–196
    of heat pumps, 196–197
  methodological issues and data collection for gas boilers, 206–207
  methodological issues for heat pumps, 204–206
    data availability and data collection, 205
    data collection for heat pumps, 205–206
Heat pump (HP), 190–191, 266, 269
  current market developments of, 196–197
  decreasing costs (prices) per unit for the case of, 207–210
  improved energy efficiency in the case of, 212
  methodological issues for, 204–206
    data availability and data collection, 205
    data collection for heat pumps, 205–206
  technology description of, 191–192
Heat pump borehole heat exchangers and heat pump modules
  decreasing costs (prices) per unit for the case of, 210–212
Heat transfer fluid (HTF), 222–223
High-CRI lamps, 243
Hybrid electric vehicles (HEVs), 148
Hydrogen production methods, 170*t*

I
IMAGE model, 36
Incandescent lamps, 236, 242–243
Industrial processes, experience curves for energy efficiency in, 50–51
Innovation activity, 14
Integrated assessment models (IAMs), 36
Interface and feedback loops between models, 294
Intergovernmental Panel on Climate Change, 26
Internal combustion engine vehicles (ICEVs), 282
International Energy Agency's Photovoltaic Power Systems Programme (IEA PVPS), 70
International Energy Agency's World Energy Outlook (WEO), 81
Inverse Carnot cycle, 191

K
Knowledge stock (*KS*), 13–14, 76–77

L
Laggards (LG), 55
Lamps, 234
Lappeenranta University of Technology (LUT), 81
Late majority (LM), 55
Lawrence Berkeley National Laboratory (LBNL), 242–243
Learning-by-doing, 23, 80
Learning-by-interacting, 23–24
Learning-by-searching, 80
Learning-by-using, 23
Learning curve, 10–12, 11*f*
  analyses, 226–227, 244–246
  and experience curve, 10–15
    single factor experience curve, 11–12
    two and multifactor experience curves, 12–15
Learning investments, 24
Learning rate (LR), 37, 40–41, 153, 155, 160
  nonconstant behavior of, 27
  uncertainty, 27
LED lamps, 240, 242–244, 250
Levelized cost of electricity (LCOE), 16, 225–226, 226*f*
  of offshore wind projects, 106, 112

of onshore wind energy, 90, 92–97
Life cycle assessment (LCA), experience curves for, 52–54
Life cycle inventory (LCI), 53
Light bulbs, 234–235
Light duty vehicles (LDVs), 55
Light-emitting diode (LED) lighting products, 233
future outlook, 248–252
component-based manufacturing cost projections, 250
discussion, 250–252
product-level price projections, 248–250
learning-curve analyses, 244–246
methodological issues and data availability, 238–241
approach to inferring cumulative production, 240–241
light-emitting diode lighting products, price data for, 238–240
price decline, main drivers of, 246–248
time-trend analyses, 241–244
in the 2010s, 234–237
Linear regression method, 20
Lithium battery storage system, 27–28, 126
Lithium-ion batteries, 121–122, 128, 265–266, 269
historical growth of sales of, 149–150, 150*f*
Lithium-ion technologies
experience and learning rates of, 133*f*
experience curves for, 132*f*
L-prize lamp, 236
Luminous lamps, 242–243

M

MESSAGE–MACRO model, 41
Methodological considerations, of experience curves, 310–315
component-based assessments, 311
cost of capacity versus LCOE and other metrics, 310–311
data availability and future data collection, 314–315
energy and climate models, application in, 313–314
environmental experience curves and social learning, 312–313
two- and multifactor experience curves, 311–312
Model coupling
effects of global learning via, 300
experience curves and, 293–294
Modern-day conventional wind turbines, 88
Module-level power electronics, 67
Monopolar cells, 178
Multifactor experience curve (MFEC), 12–15, 18, 38, 68, 311–312
Multifactor learning curves, 45, 108–110, 116, 133–134
for silicon photovoltaic module prices, 76–77
Multistacking, 178, 182

N

Natural gas condensing gas boilers, 193, 198–199
NEEDS project, 22
NEMA lamp, 240
Nonlinear regression method, 20
Notice of Proposed Rulemaking (NOPR), 248

O

Offshore wind energy, 103
data collection issues for, 106*t*
experience curve analyses, 107–110
future outlook, 113–115
main drivers behind cost and price changes, 110–113
methodological issues and data availability, 105–107
One-factor experience curve (OFEC), 12–14
One-factor learning curves, 130–133
Onshore wind energy, 87
data collection and methodological issues, 98–99
experience curves for, 93–98
future outlook, 99–100
market development, 88–90
trends in capital expenditures and levelized cost of energy, 90–93
Open-cycle gas turbines, 271–272
Optimization models, 35, 43–44, 263

P

Paris Climate Agreement, 198
Photovoltaic (PV) solar energy, 63
data collection issues for photovoltaics, 72*t*
future outlook for prices of photovoltaic modules, systems, and balance of system components, 81–83
methodological issues and data availability, 68–71
observed cost reductions, analysis and quantification of, 78–80
recommendations for science, policy, and business, 83–85
silicon photovoltaic module prices, multifactor learning curves for, 76–77
state-of-the-art experience curves, 71–76
Photovoltaic (PV) technology, 53
Plug-in hybrid electric vehicles (PHEVs), 56–57, 148, 284
Policy makers, applications of experience curve for, 21–27
direct applications, 23–26
indirect application, 26–27

PowerACE, 261–264
uncertainty of experience curve parameters in, 270–272
Price decline, main drivers of, 227–228, 246–248
Price developments of technologies, 45
Product-level price projections, 248–250
Progress rate (PR), 37
Proton exchange membrane (PEM) cells, 166, 169–170
Pumped hydro storage, 120–121
P-values, 21

R

RAND Corporation, 11–12
Redox-flow batteries, 265–266, 269
REFLEX project, 18, 22, 42–43, 260, 261*f*, 266–268, 276–277
Regression method, 20
Renewable energy sources (RES), 190–191
Research and development (R&D) portfolio, 4–5
Risk premium (RP), 54–55

S

Schmidt–Oerlikon cell, 167
Seasonal energy-efficiency rating, 201–202
Sensitivity analyses, results of, 297–299
Silicon photovoltaic module prices, multifactor learning curves for, 76–77
Simulation models, 35
Single-factor experience curves, 11–12, 38
Social learning (SL), 54–60
environmental experience curves and, 312–313
modeling risk premiums and social and technological learning, 55–56
model setup, 56
scenario framework, 56
technological learning scenarios, 57–60
in transport sector, 55
Sodium–sulfur batteries, 127–128
Solar electricity generation systems (SEGS) plants, 223–224
Solar thermal electricity, 221–222
Solid State Lighting (SSL) program, 236, 253–254
Specific energy consumption (SEC), 50
Spillover effects, 44, 125–126, 154
S-shaped curve, 244
State-of-the-art experience curves, 71–76
Steam methane reforming (SMR), 169
Strategic Energy Technology Plan (SET Plan), 160–161
Supercapacitors, 123
System dynamics (SD) transport modeling, 284

T

Technological progress, 38, 45
Technology diffusion, 44, 54, 262–263, 291
Technology outlook till 2030, 315–317
Thermal energy storage (TES), 221–222
Time trend analyses, 225–226, 241–244
Top-down energy models, 34
Total cost of ownership (TCO) approach, 35, 287–288
Transport, Energy, Economics, and Environment (TE3) model, 283, 288–292
modular structure of, 289
vehicle fleet and technology diffusion in, 289–292
Transportation systems, 146
Transport sector, social learning in, 55
Two-factor experience curve (TFEC), 12–15, 76–77, 125, 311–312

U

United Kingdom, offshore wind capacity in, 104–105

V

Vehicle fleet and technology diffusion
in ASsessment of TRAnsport Strategies, 286–288
in Transport, Energy, Economics, and Environment (TE3) model, 289–292

W

Water electrolysis, 167
Weighted average cost of capital (WACC), 92, 106, 113
Willingness-to-pay (WTP), 55
Wind turbines, 29, 54, 88–91, 88*f*
Wright's law, 125
