The authors regret that errors were made with regard to the reporting of several methodological details in the Materials and methods section. The authors would like to apologise for any inconvenience caused by this. Corrections are described below.

Materials and methods

Experimental design – Food image viewing fMRI task

The text and Fig. 2 erroneously mention a randomized inter-block interval duration between 8 and 16 s. The actual interval ranged between 3.5 and 4 s as inferred from the logfiles. In the reported analyses the correct timings were used, based on the logfiles of each scan. Thus, the reported results are unaffected.

Corrected text and Fig. 2:

Fig. 2. Each block was followed by an inter-block interval (i.e. black screen with crosshair) with a duration between 3.5 and 4 s.

Experimental design – Image acquisition

The TR of the EPI scan sequence was 1400 ms, not 1600 ms. The flip angle was 70° not 72.5°. The correct TR of 1400 ms was used in the viewing task analyses.

Corrected text: Functional images were obtained with an 8-channel SENSE head-coil using a 2-D echo planar imaging (EPI) sequence with the following parameters: voxel size 4 mm isotropic; repetition time (TR) = 1400 ms; echo time (TE) = 23 ms; flip angle = 70°; 30 axial slices; SENSE-factor R = 2.4 (anterior-posterior).
