FIGURES

1.1 The relationship between median settling velocity and concentration for muds of various estuaries. The numbers are the value of $n$ in the formula $W_s = aC^n$. $W_s$ = settling velocity, $C$ = suspended sediment concentration, $a$ and $n$ are constants (Dyer, 1989) 19

1.2 Median settling velocity obtained from field settling tube measurements as a function of the suspended sediment concentration at two locations in the Ems estuary (Van Leussen, 1994) 20

1.3 Concentration of counter and co-ions in a diffuse double layer on a negatively charged surface for two values of the equilibrium concentration, $c_0,1$ and $c_0,2$. $u$ = extent of diffuse double layer (after: Bolt & Bruggenwert, 1978) 21

1.4 Idealized model of particle diffuse electric double layer and interaction energies. (after: Van Olphen, 1977) 22

1.5 Schematic picture of polymer bridging and the repulsive energy barrier at the particle surface (Gregory, 1978; reprinted with kind permission from Kluwer Academic Publishers) 25

1.6 Flocculation and restabilization by adsorbed polymers (Gregory, 1978; reprinted with kind permission from Kluwer Academic Publishers) 26

1.7 A conceptual flocculation model. (Dyer, 1989) 27

1.8 Schematic picture of floc structure (François, 1985) 30

2.1 The Dollard estuary 35

2.2 The Video In Situ (VIS) (Van Leussen & Cornelisse 1993b) 37

2.3 The Video In Situ (VIS) 38

2.4 The Owen tube (Valeport Braystoke SK110) 41

2.5 Operation of the Owen tube Braystoke SK110 (drawing: P. van der Wal) 42

2.6 The Cilas 925 laser particle sizer 44

2.7 Floc size distribution determined with the Video In Situ in the tidal Channel "Groote Gat" throughout the tide on 18 April 1996 45

2.8 Floc size distribution determined with the Cilas laser particle sizer in the tidal Channel "Groote Gat" throughout the tide on 18 April 1996 45

2.9 Water level and current velocity on 18 April 1996 46

2.10 Cilas floc sizes at about half the water depth from anchored measurements 46

2.11 Floc breakup around the Cilas due to current shear 47

2.12 The BOA measurement platform 52

2.13 The instrument pole on the BOA platform 52

3.1 VIS measurements, Dollard, 11 October 1995. a) Water level and bed level against time b) Floc size distribution against time c) Depth averaged velocity and Suspended sediment concentration in the VIS against time 62

3.2 VIS measurements, Dollard, 11 October 1995. a) Floc size distribution against time b) Normalized velocity profiles (contours) and SSC profiles (gray-scales) against time 63

3.3 Settling velocities measured by Van Leussen (1994) in the “Ranselgat” tidal channel and settling velocities measured in the “Groote Gat” tidal channel. Video In Situ (VIS) data and field settling tube data 65

3.4 Cilas measurements, Dollard, 11 October 1995. a) Floc size distribution against time (data from: M. Ebben, RIKZ) b) Water level and significant wave height against time c) Current velocity and SSC against time 67

3.5 Tidal sequence of the floc settling velocity distribution above the Heringsplaat on 12 June 1997 68

3.6 a) Median settling velocities of the suspended sediment throughout the tidal cycle. Based on Owen tube measurements taken throughout 1997 on three tidal flats in the Dollard estuary b) Representative current velocities above the tidal flats 70

3.7 G in the tidal channel and above the tidal flat, Dollard, 11 October 1995. a) Depth averaged velocity and G in the tidal channel b) Current velocity, Wave height and G at 30 cm above the tidal flat c) G at 1.5 cm above the tidal flat 72

4.2 VIS measurements 11 October 1995

4.3 VIS measurements 19 October 1995

4.4 a) Seasonal variation of mud floc size b) Seasonal variation of suspended sediment concentration c) Wave height, EPS, LOI, Chlorophyll-a* and water temperature* (* data from the National Institute for Coastal and Marine Management (RIKZ), The Netherlands)

4.5 VIS measurements 29 May 1996

4.6 Observed Phytoplankton in the Dollard estuary. (Source: National Institute for Coastal and Marine Management (RIKZ), The Netherlands)

5.1 a) Floc size measurements and chlorophyll-a throughout the seasons b) Suspended sediment concentration and wave height throughout the seasons

5.2 a) Size versus settling velocity of mud flocs b) Size versus density of mud flocs (VIS measurement of 8 August 1996 11:59 h)

5.3 Settling velocity and suspended sediment concentration throughout the tidal cycle (Time is normalised to high water)

5.4 Seasonal variation of floc size and settling velocity

6.1 Floc size and settling velocity as a function of turbulent shear (After Winterwerp, 1999)

TABLES

5.1 Constants a and n in equation 5.2 as was calculated from the VIS data

6.1 Suspended sediment distribution over the depth as a function of the ratio between u* and w_s (Van Rijn, 1993)
