

Acknowledgements

During my time as a PhD student, a lot of people from different areas at the NIOZ, such as the BIO department, the molecular lab, the nutrient lab, and of course the MBT department were of great help to me and made it possible for me to realize this thesis.

Special thanks go out to Bouwe Kuipers who helped me in many ways during my start at the NIOZ. He introduced me to a lot of people at the institute and he helped me with the setup of my mesocosm experiments. Thanks also to Govert van Noort who helped me with the microscopy and Anna Noordeloos for her helpful advice concerning sampling and cultivation methods. Arjan Smit, Elena Stoica and Thomas Reinthaler also thanks for their help with the CARD- FISH technique.

Special thanks go out to the head of the BIO department, Gerhard Herndl, who allowed me to use all the facilities in his department and also for his helpful revision on my manuscripts and for helpful scientific discussions.

There are of course the people from the molecular lab Ben (“Benni”) Abbas, Marco Coolen, Judith van Bleijswijk and Harry Witte who were of great help with my DNA sample processing. They created a very nice working atmosphere.

Thanks also to Jan van Ooijen, Karel Bakker and Eveline van Weerlee from the nutrient lab who quickly processed “hot” samples within only two days!

From the MBT department, special thanks go out to Michiel Kienhuis who helped me with my computer problems, Ellen Hopmans for teaching and helping me with the HPLC/MS and Irene Rijpstra who teach me to extract and analyze lipids. Special thanks also to Lydie Herfort, Astrid Forster, Sebastian Rampen who helped me with the regular sampling of the mesocosm experiments and Martijn Woltering for helping me with the lipid extraction and analyses. Also thanks to the “strong males from MBT” who regularly helped to carry the 20 liter bottles for the label incubation series. In general, I want to thank the people of the MBT department for creating a fruitful and nice working atmosphere.

Here, I also want to say a few words and special thanks to my promotor Jaap S. Sinninghe Damsté and co-promotor Stefan Schouten. First I want to thank them for giving me the opportunity to work on this PhD project. The combination of lipid and DNA work made it a challenging and interesting project. During my time as a PhD student Jaap and Stefan gave me

a lot of freedom to set up all kinds of different experiments. When it came to structuring the data and writing the manuscripts, Jaap and Stefan were extremely efficient and helpful. They always had time to discuss my data and I knew that when I handed in a new draft of a manuscript that I would have the correction from both, Jaap and Stefan, within two days. Coming from a German University I know this is exceptional (there you sometimes have to wait half a year till you even see your Professor!). Thus, I know that my thesis would not be written in this form if I would not have had the excellent support of Jaap and Stefan. Thank you very much!
